T_{SOLD}	Lead soldering temperature (10sec max)	300	°C

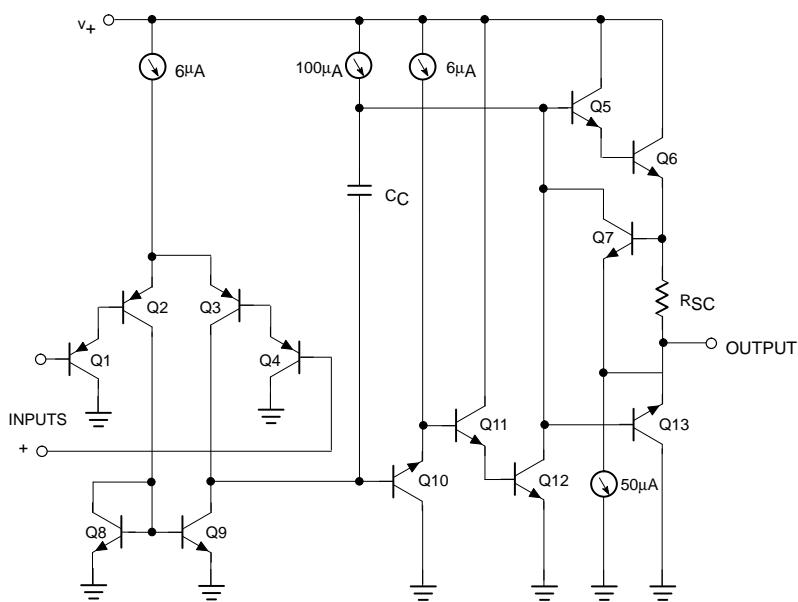

NOTES:

1. Derate above $25^\circ C$ at the following rates:
F package at $9.5\text{mW}/^\circ C$
N package at $11.4\text{mW}/^\circ C$
D package at $8.3\text{mW}/^\circ C$
2. Short-circuits from the output to V_{CC+} can cause excessive heating and eventual destruction. The maximum output current is approximately 40mA, independent of the magnitude of V_{CC} . At values of supply voltage in excess of $+15V_{DC}$ continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction.
3. This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input bias clamps. In addition, there is also lateral NPN parasitic transistor action on the IC chip. This action can cause the output voltages of the op amps to go to the $V+$ rail (or to ground for a large overdrive) during the time that the input is driven negative.
